Introduction

Programmed Nutrition (Alltech Inc.) is a nutritional program that can be used to promote the performance and health of feedlot animals, particularly in programs where in-feed antimicrobials are not used.

• Programmed Nutrition Beef Program can increase body and carcass weight without compromising carcass quality, and DMI while maintaining feed:gain. However, it causes an increase in liver abscess incidence.

Hypothesis

Programmed Nutrition (PN) may influence rumen fermentation since performance is equivalent to Monensin, a known fermentation modifier

Objective

Determine the impact of Programmed Nutrition Beef Finisher versus a traditional feedlot program (Monensin + Tylosin) on metabolic changes in steers fed a high concentrate diet

Materials and Methods

- 8 cannulated Holstein steers used in a replicated 4 x 4 Latin square
- Steers fed once daily (0700) at 2.0 x NEm

Treatments added at 75 g/head/d:

1. Control conventional trace mineral supplement (C)
 2. Programmed Nutrition Beef Finisher supplement (PN)
 3. Control supplement + Monensin + Tylosin (MT)
 4. Programmed Nutrition supplement + Monensin + Tylosin (PNMT)
- Monensin = 450 mg/head/d Tylosin = 90 mg/head/d

Experimental Period:

- Body Weight (BW) determined in the first and last day of each period
- D 1 to 14: Treatment Adaptation
- D 15 and 16: Ruminal pH measured continuously; rumen fluid collected every 2h
- D 19 to 26: Total urine and feces collection using individual metabolic stalls
- D18 to 23: Urine sample collected for protein turnover analysis via single dose (5 mg/kg BW) of ¹⁵N-glycine abomasally
- D 20 to 22: Heat production determined using indirect calorimetry headbox units
- D 27: Blood samples collected at 0h, 2h, 4h and 6h post-feeding for analysis of blood plasma insulin

Statistical Analysis

- MIXED Procedure of SAS
- Mean differences analyzed using LSD
- Blood plasma insulin, rumen VFA and rumen pH analyzed using least square means repeated measures
- Considered significant when P < 0.05 and a tendency when P < 0.10

Conclusion

• Although no differences in average daily gain and dry matter digestibility were observed, significant metabolic changes occurred when supplementing Programmed Nutrition with or without Monensin + Tylosin, which could lead to different repartitioning effects in the carcass.

• Data indicates that Programmed Nutrition is a fermentation modifier that generates metabolic changes.

Results

Table 1. Parameters of Programmed Nutrition Beef Finisher and Monensin + Tylosin at 75 g/head/day.

| Item | Treatment | | | | SEM | P-value | | |
|---|---------------------|---------------------|----------------------|---------------------|--------|---------|--------|---------|
| | C | PN | MT | PNMT | | MT | PN | PN x MT |
| Dry Matter Intake, kg/d | 8.84 | 8.79 | 8.65 | 8.70 | 0.37 | 0.2966 | 0.9701 | 0.6942 |
