Introduction

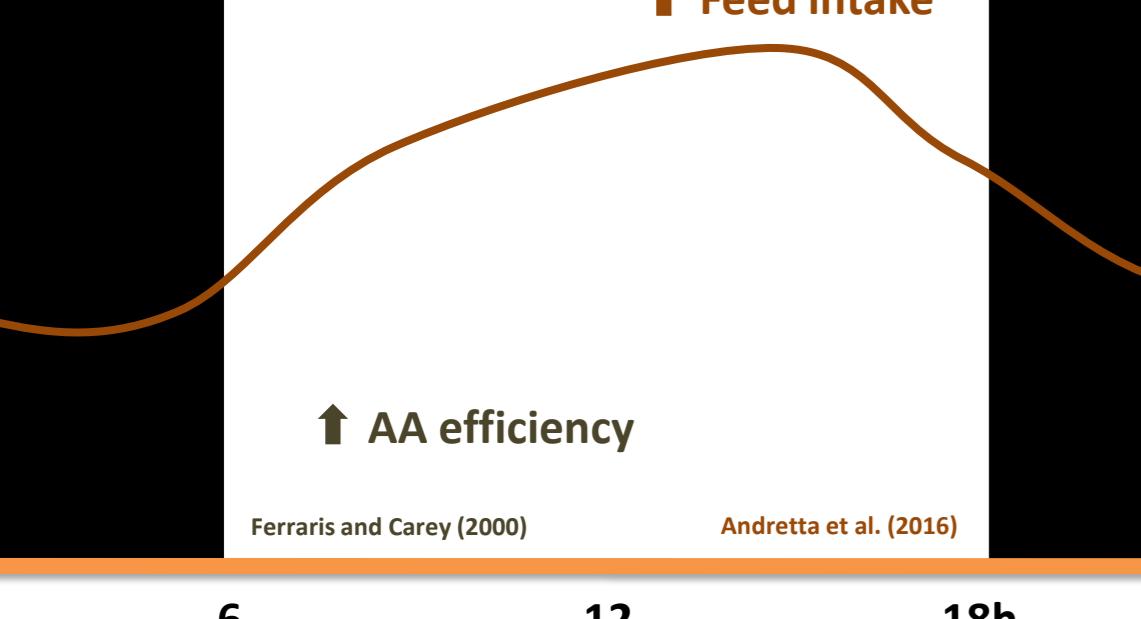

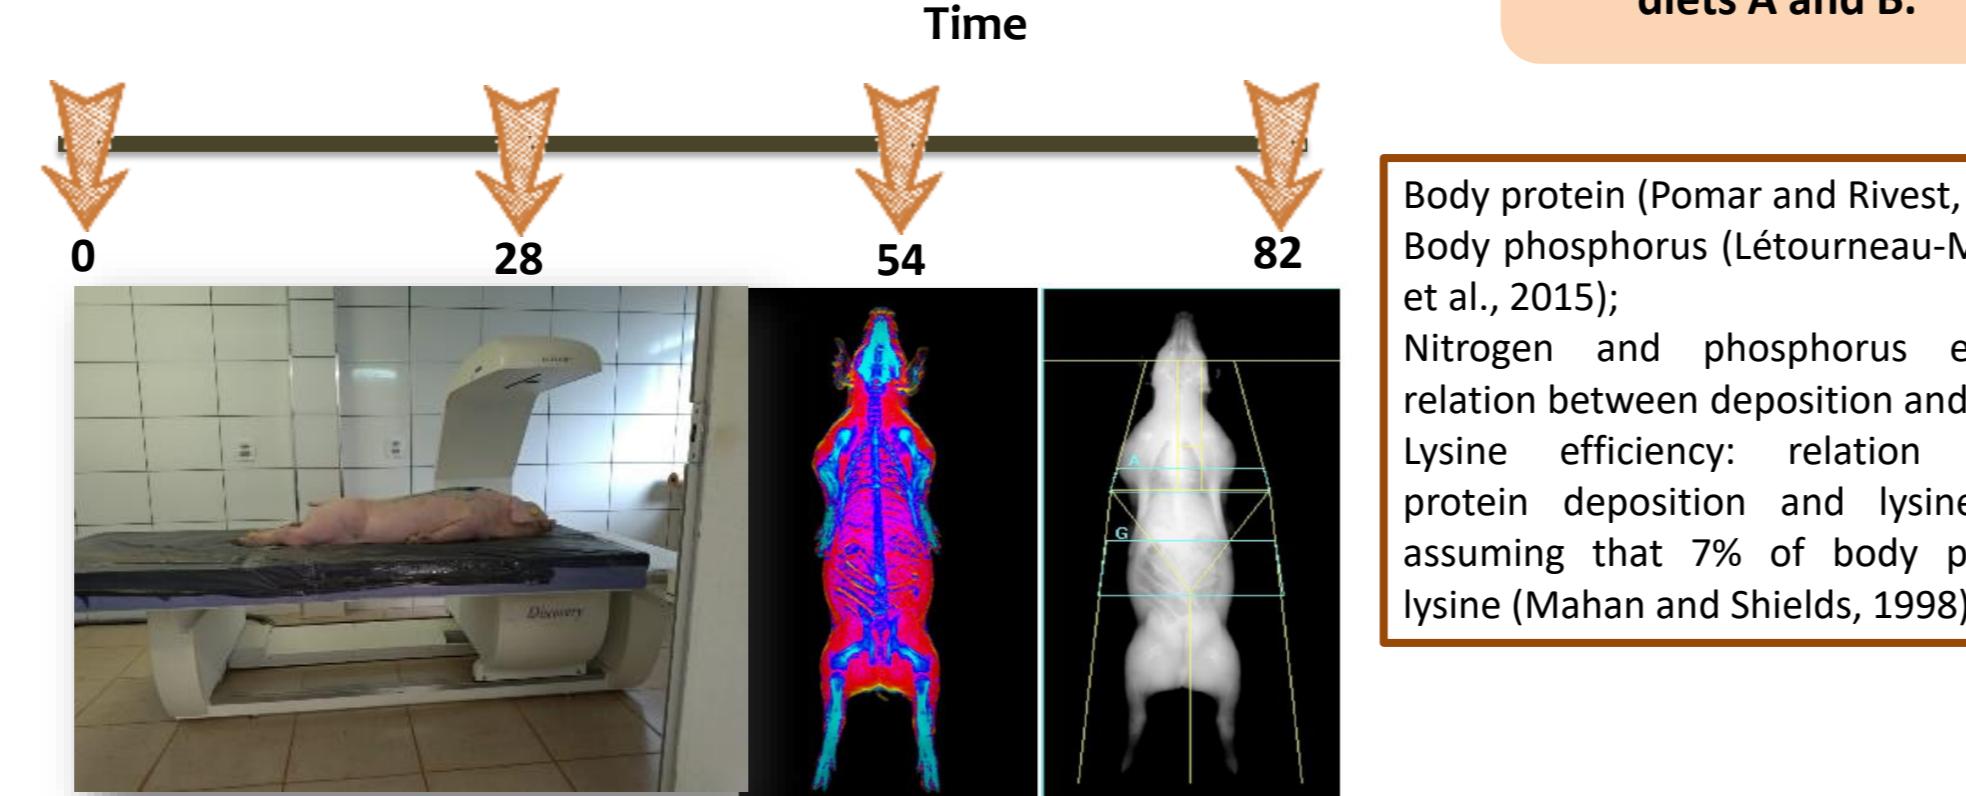

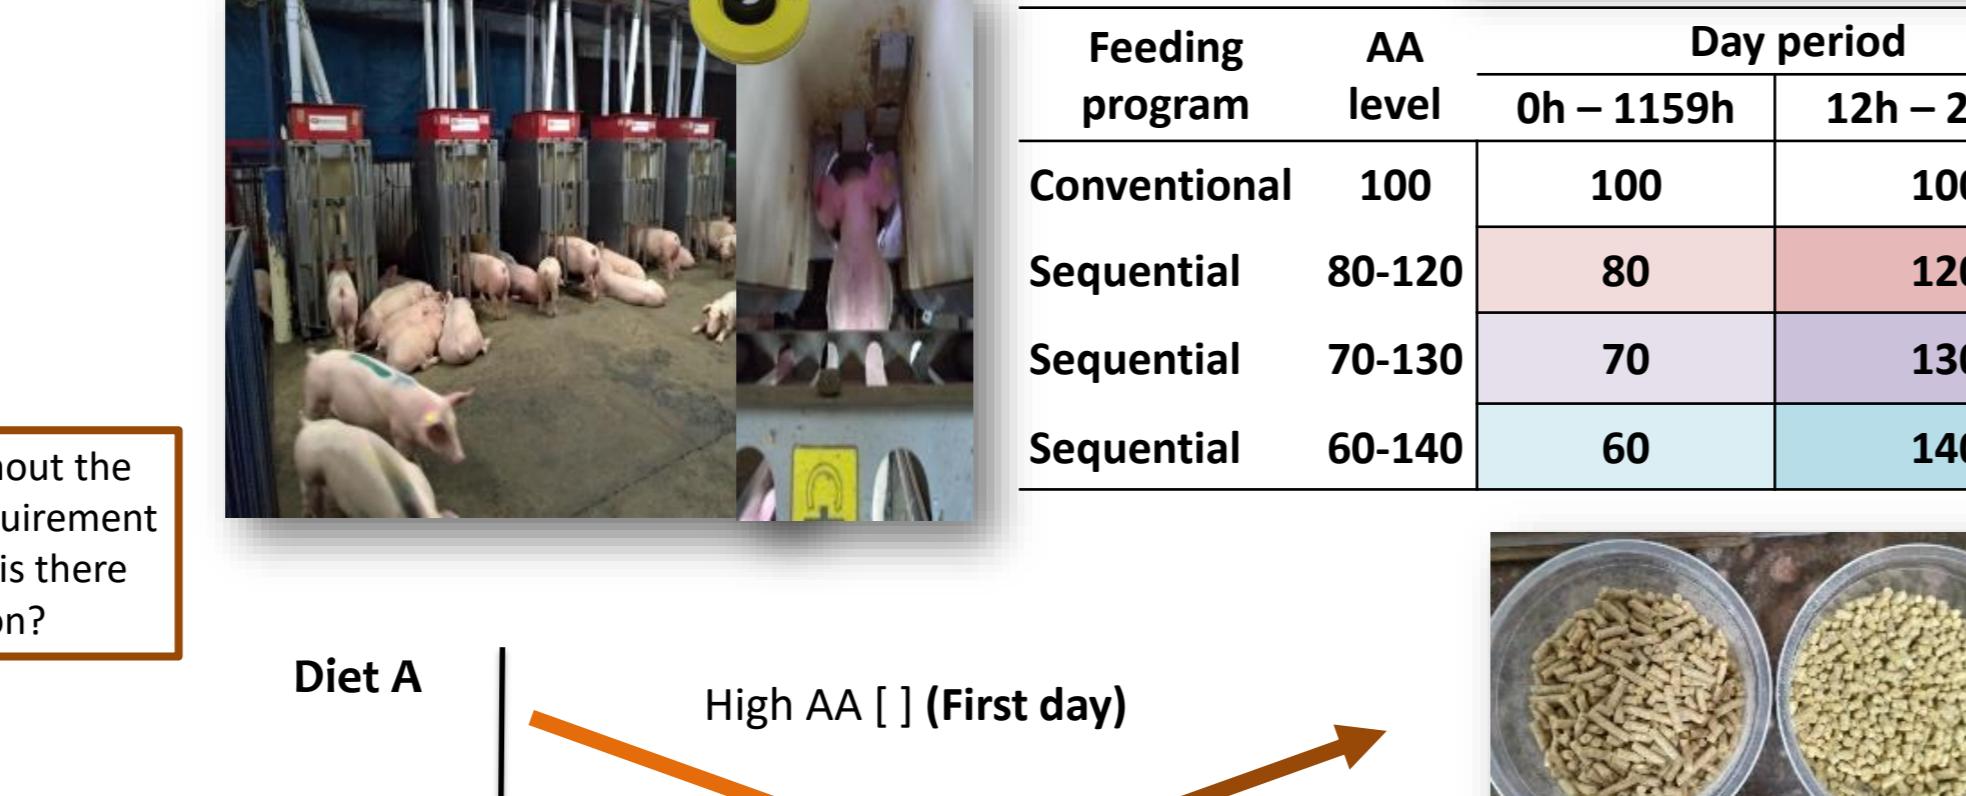

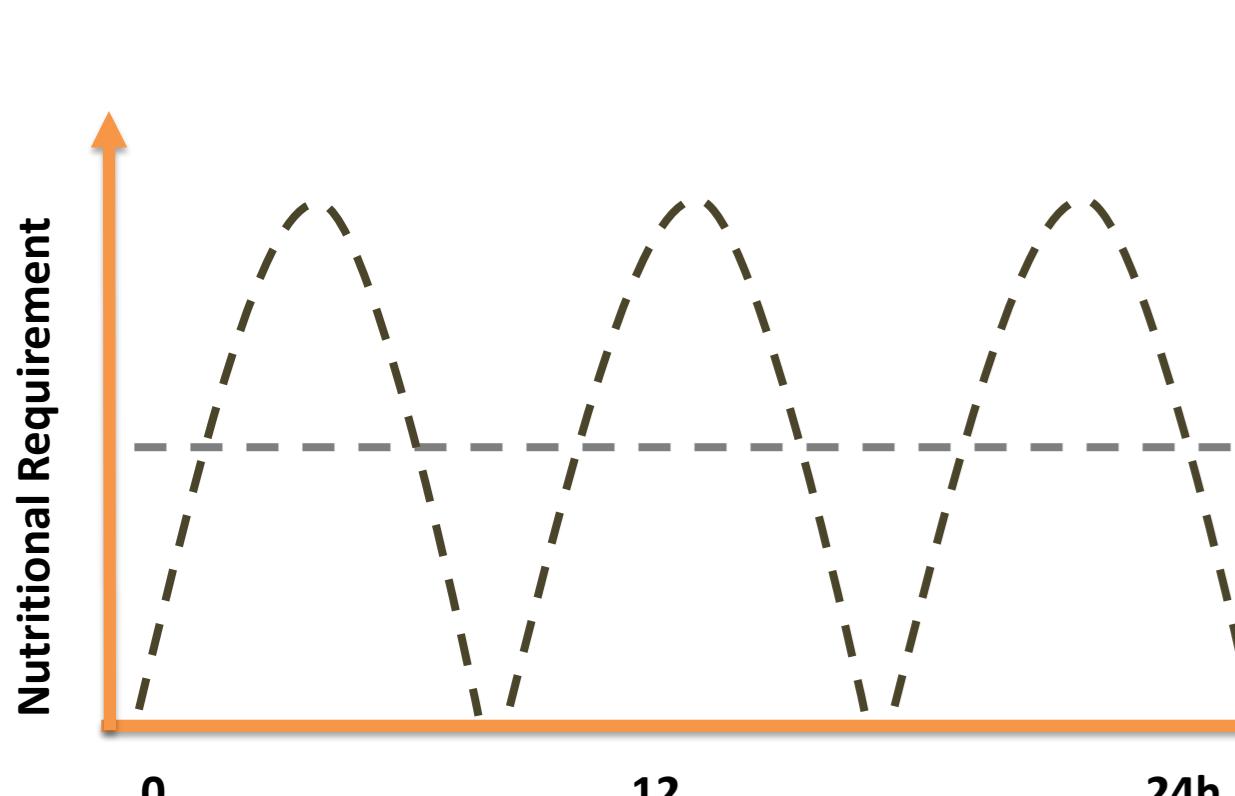

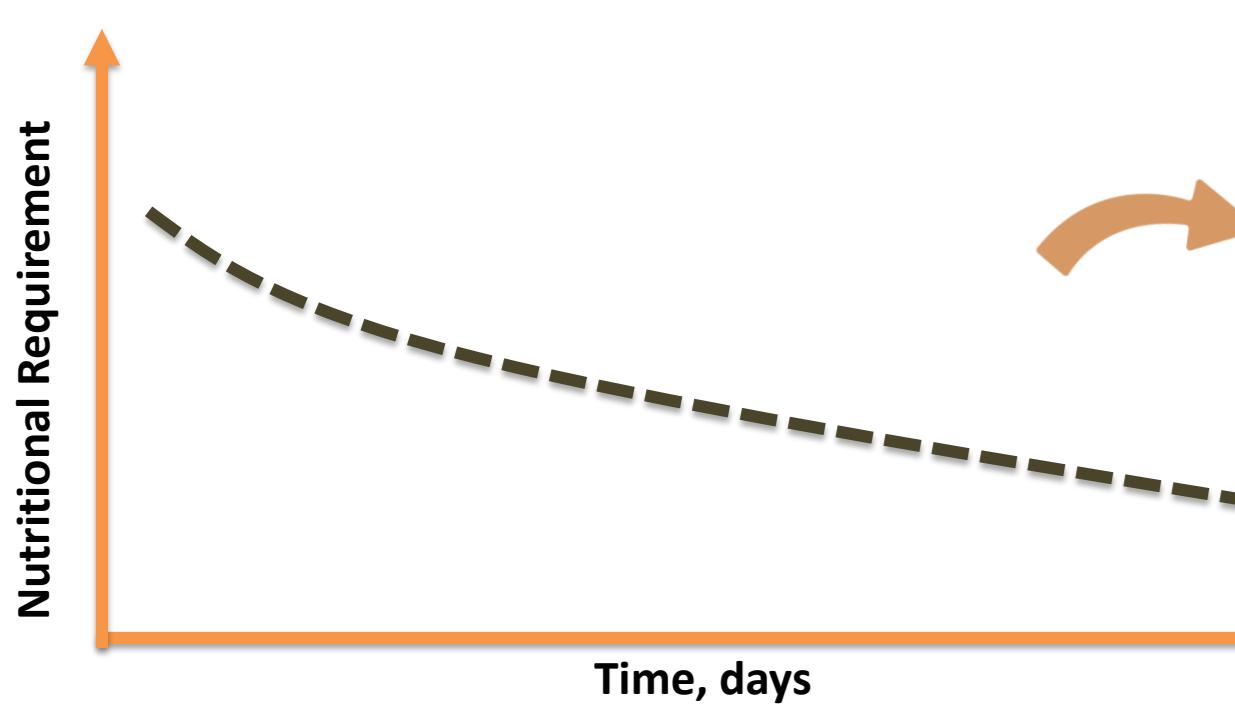

Feeding pigs with different diets throughout the day, through the technique of sequential feeding, improves nutrient balance?

Objective

This study evaluated the effect of conventional and sequential feeding programs with diets varying in amino acid content over the day on nutrient balance for growing-finishing pig.

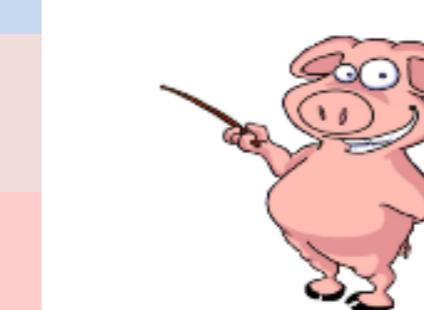

Statistical analysis

Contrast 1	CONV 100	vs	SEQ 80-120
Contrast 2	CONV 100	vs	SEQ 70-130
Contrast 3	CONV 100	vs	SEQ 60-140

P < 0,05
0,05 < P ≤ 0,10

	Feeding programs			SEM	Contrast P-values ²

Summarizing...

- Pigs from SEQ80-120 had a similar nutrient balance than pigs from CONV.
- Pigs from SEQ70-130 had higher nitrogen and phosphorus retention, however higher excretion than CONV pigs.
- Pigs from SEQ60-140 had higher nitrogen and phosphorus retention with a similar excretion that pigs from CONV.

Conclusion

According to our results, sequential feeding program improves nutrient balance of pigs at the beginning of the growth period.
